

VERSION 1 — CONCEPT & ROLES

Know your build before you spend a shilling.

A construction cost & project-planning estimator for Kenya. A visitor describes what they want to build — Allura Works instantly returns a credible cost, a stage-by-stage breakdown, and a timeline.

THE PROBLEM

Everyone who wants to build hits the same wall first.

?

No idea what it costs

Quotes vary wildly, and a real BOQ requires paying a professional before you even know if the project is feasible.

?

No idea of the process

What comes after the foundation?
When do you pay for what? Which professionals do you actually need, and when?

?

No one to trust yet

Advice comes from whoever wants the job. There is no neutral first step between "I have a dream" and "I've hired someone."

That confusion — before any money moves — is the gap Allura Works exists to close.

THE SOLUTION — V1

Describe it. Understand it. In seconds, for free.

Pick a project

3BR bungalow · 4BR maisonette

**Your details**

area · location · finish level

**Instant estimate**

cost · stages · timeline · journey

**EXAMPLE — 150 M² BUNGALOW,
NAIROBI****KES 3.45M ±15%**
at KES 23,000 per m², standard finish**THE JOURNEY****11 stages**each with cost, duration, materials, and
the professionals needed**THE TIMELINE****≈ 6 months**durations scale automatically with floor
area

A planning estimate with a stated margin — not a BOQ. Honest about what it is, useful from day one.

HOW IT WORKS

A tiny engine on top of deep construction knowledge.

$$\text{rate} = \text{baseRatePerM2} \times \text{finish} \times \text{location}$$
$$\text{total} = \text{rate} \times \text{areaM2}$$
$$\text{stageCost} = \text{total} \times \text{elementWeight}$$

Cost is computed **top-down** — credible immediately, no waiting for perfect data. Material quantities are stored as **rates** (blocks per m², cement per m²), so one template produces a correct, scaled material list for any floor area. As real prices mature, the numbers converge toward bottom-up accuracy without a rebuild.

ONE DATASET, TWO VIEWS

A single array of stages drives both the **build journey** (timeline & storytelling) and the **QS-style cost plan** — they can never drift apart.

COST ELEMENT	SHARE
■ Preliminaries	5%
■ Substructure	15%
■ Superstructure	30%
■ Roofing	12%
■ Finishes	22%
■ Services	10%
■ External works	6%

WHY THIS SCALES

The knowledge is the moat. Growth is content, not code.

THE CORE OBJECT — BUILDINGTEMPLATE

Every project on the platform is **one JSON document**: base rate, multipliers, element weights, and stages with materials stored as rates.

- Adding the 2nd, 10th, or 100th house type = **adding a document**, never writing code
- Published through an admin panel — no developer in the loop
- Photos, plans, and refined prices drop into existing slots

WHAT COMPETITORS WOULD HAVE TO COPY

- Verified **cost rates per m²** across regions and finish levels
- Stage-by-stage **weights, durations, and material rates** validated on real Kenyan builds
- A growing library of **real stage photos** and professional-drawn plans

The software is a thin engine. The construction intelligence inside the templates is what a stranger pays for — and it compounds with every project added.

THE TEAM — TWO ROLES, ONE CONTRACT

The developer builds the engine. The construction engineer builds the intelligence.

REGINALD — DEVELOPER · "THE ENGINE"

- **Data model & schema** — defines the BuildingTemplate / StageTemplate shape
- **generateEstimate()** — the provably-correct pure calculation function, with tests
- **Admin panel & persistence** — the CRUD that lets knowledge enter without code
- **Frontend** — input flow, results page, donut, timeline; renders whatever a template contains
- **Payments & reports** — the KES 500 unlock and PDF generation

Owns correctness: the math, the tests, the uptime. Never invents a construction fact.

ALLAN — CONSTRUCTION ENGINEER · "THE INTELLIGENCE"

- **Rates & multipliers** — cost per m², finish and location factors, element weights
- **Stages** — the real sequence, durations, descriptions, and tips per house type
- **Materials & prices** — quantities as rates (per m² / per floor) and current market prices
- **Professionals per stage** — who is needed, when, and what they check
- **Field content** — stage photos from live sites, validation against real builds; delivers the billed expert opinions

Owns credibility: the numbers a stranger would pay for. Never touches code — fills a form.

The contract between them is the BuildingTemplate JSON. Fixed early, it lets both work in parallel: the engine is built and tested against a draft while the real numbers are refined — and refined numbers drop in without touching code.

BUSINESS MODEL

Free to understand. Paid to go deeper.

STEP 1 · FREE

Estimate

Instant cost, stages, and timeline. No sign-up. This is the traffic engine and the trust-builder.

KES 0

STEP 2 · INSTANT, AUTOMATED

Detailed report

Full indicative material bill with prices, payment schedule, professionals per stage, shareable PDF.

KES 500 one-time

STEP 3 · BILLED, HUMAN EXPERT

Expert opinion

A registered QS reviews the estimate for the client's actual plot — written opinion, adjusted figures, a call. Delivered by the construction engineer's network.

from KES 5,000 per opinion

A natural ladder: software scales the first two steps; the third monetizes human expertise and seeds the future professionals marketplace.

ROADMAP — PROVE THE ENGINE BEFORE BUILDING AROUND IT

Ship in provable layers.

PHASE 0 · NOW**The provable core**

- Two schemas + one hand-authored bungalow template
- Pure **generateEstimate()** with passing tests (150 m² → KES 3.45M ✓)

Done when: the engine reproduces the mockup math.

PHASE 1**Persistence + admin**

- Templates move into the database
- Admin CRUD: rates, stages, images, publish

Done when: Allan adds a project with no developer involved.

PHASE 2**Public frontend**

- Input page → results page (donut, stages, timeline)
- The KES 500 report unlock + expert-opinion request

Done when: a stranger goes input → estimate → understands their project.

Deliberately out of V1: marketplace, suppliers, messaging, reviews, project tracking, real-time 3D. We say no on purpose so V1 ships. **Later:** real stage-photo pipeline from live sites, professional partnerships, more templates every month.

WHAT V1 SUCCESS LOOKS LIKE

A visitor arrives confused, and leaves with a plan — in under a minute.

Behind that: one carefully prepared building template, a provably-correct engine, and an admin panel that makes every new project **content, not code**. From there we never rebuild — we add templates, deepen the knowledge, and layer professionals and suppliers onto the same core object.
